CANopen Configuration Tool 2.1.8

This release of CANopen Configuration Tool is mostly a bug fix release. It had been reported that Conftool was previously unable to write `VISIBLE_STRING` type data to the Object Dictionary of a node which had entries of this type with read/write access. It was also found that when reading a `VISIBLE_STRING` type of exactly 3 character length, only the first character would be displayed to the user. Both these issues have now been fixed.

New and Changed Functionality

- None

Bugfixes

- `VISIBLE_STRING` data can now be written to nodes
- When reading `VISIBLE_STRING` data that is 3-character-long, it is displayed correctly in the GUI
- Handling of demo licenses has changed

Known Issues

- Does not work with version 2.0.6 of the Castor USB Driver
